1 CCAT Class

The *ComputerControlledAutomaticTransmission* class is formalized thanks to the code reported in Listing 1 while Figure 1 shows the *big picture* of our complete designed.

Listing 1: ComputerControlledAutomaticTransmission.trio

```

1  class ComputerControlledAutomaticTransmission
2
3  import :
4      HydraulicSystem ,
5      PlanetaryGearSet ,
6      TransmissionControlUnit ,
7      VehicleSpeedSensor ,
8      EngineSpeedSensor ;
9
10 signature :
11
12 visible :
13     torqueConverterState ,

52     vehicleSpeedSensor.sendSpeed)
53 end
```

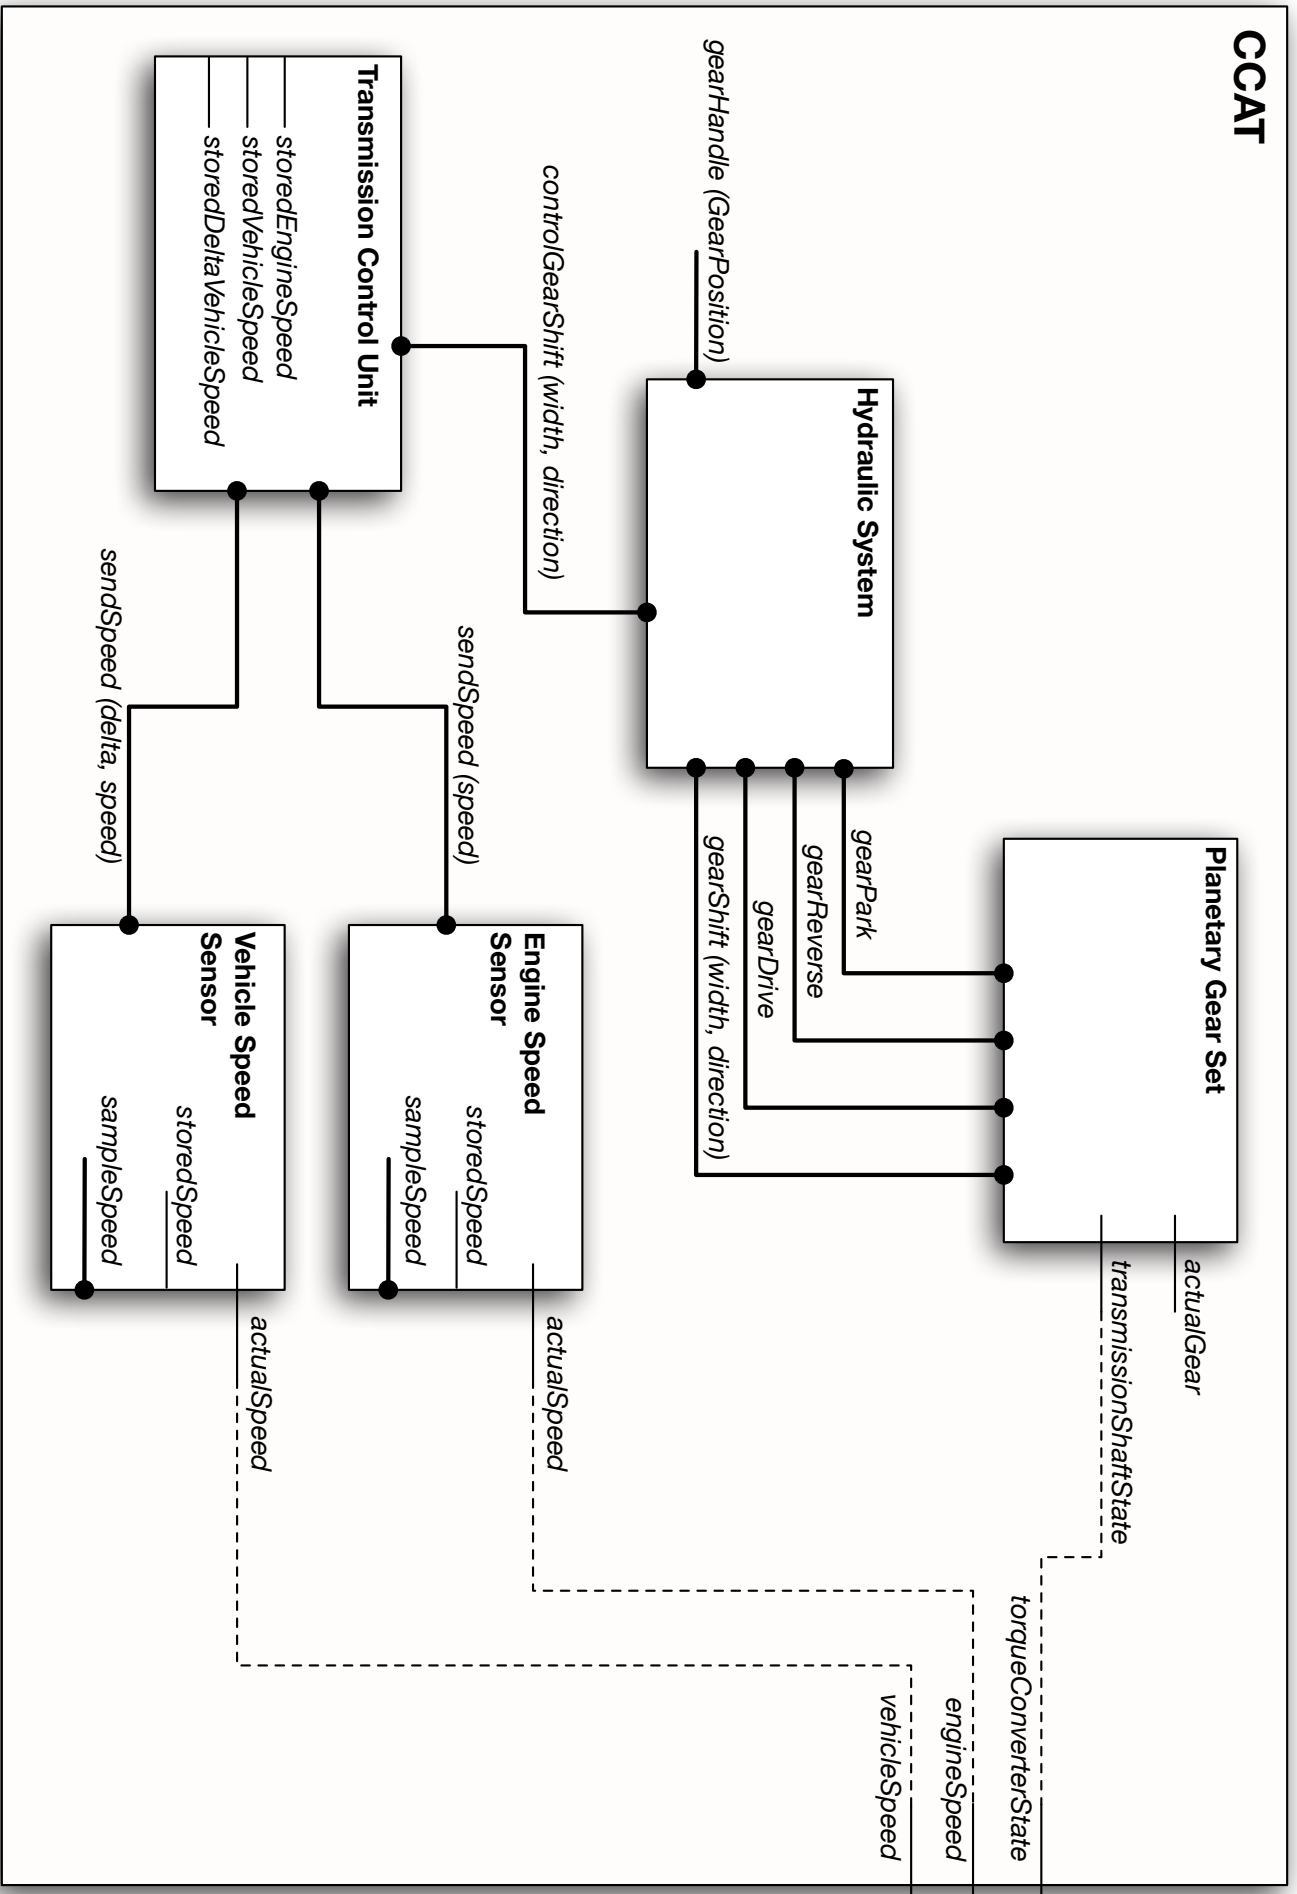

Figure 1: Computer Controller Automatic Transmission

Due to the fact that a TRIO specification is not decidable we have decided to focus our verification process only on the Hydraulic System, described in Section 4, and on the Planetary Gear Set, described in Section 3 and we have used a decidable subset of the TRIO language.

The specification is reported in Listing 2.

Listing 2: ComputerControlledAutomaticTransmission.trio

2 Vehicle/EngineSpeedSensor Classes

The *VehicleSpeedSensor* is formalized thanks to the code reported in Listing 4 while the *EngineSpeedSensor* is formalized thanks to the code reported in Listing 5.

During the formalization of sensors we decided to simplify the design assuming that every time a `sampleSpeed` event occurs the state variable `actualSpeed` - which is time dependent and total - is automatically updated with the actual measured speed. This means we don't provide any axioms formalizing this behavior.

Moreover, we specified the starting point of the constant frequency sample chain saying that sometimes in the past there was a `sampleSpeed` occurrence. Further more, we guarantee that `sampleSpeed` events will occur at constant frequency. In addition, if the sensor has memory we imposed that the `storedValue` is equal to 0. These can be considered just like the "initial conditions" of the system.

At the end, we guaranteed a sensor performs the needed action if and only if a sample event occurs.

We didn't write any axioms specifying the fact that a `sendSpeed` event is mutually exclusive with itself due to the `total` time dependent parameter it accepts.

39     end
```

3 PlanetaryGearSet Class

The *PlanetaryGearSet* class is formalized thanks to the code reported in Listing 6.

The Planetary Gear Set guarantees that every time a gear shift event occurs the `actualGear` will be maintained until the shift is finished.

Inside this component are defined all axioms limiting gear shifts to effective ones only (e.g. it is impossible to shift down a gear if `actualGear` is `First`). The Planetary Gear Set permits to shift up to two gear at the same time (as the specification asks), however, the Transmission Control Unit doesn't use this possibility because in a real Planetary Gear Set this is not possible.

Moreover, through the formalization of the Planetary Gear Set we impose that we can't receive a gear shift event if we are in the middle of a gear shift. Different gear shifting times are defined for different gears and different steps.

The gears `Drive`, `Park`, and `Reverse` can be selected if and only if the transmission shaft is decoupled from the engine.

The state of the Planetary Gear Set changes if and only if an event occurs.

Listing 6: PlanetaryGearSet.trio

      (actualGear = gear));
93
94 end
```

4 HydraulicSystem Class

The *HydraulicSystem* class is formalized thanks to the code reported in Listing 7.

The first assumption we made before modelling the Hydraulic System was that every valve and electrovalve configuration imposes the same fluid propagation delay; this means that for every command that the Hydraulic System propagates the delay will always be the same. This behavior is formalized with the time independent constant `fluidPropagationDelay`.

The *manual valve*, which permit the driver to manually select the gear mode, is modelled thanks to the `gearHandle` event and the `GearHandle` axiom. During the time in which the Hydraulic System propagate a command there can be no `gearHandle` event which somehow means the fluid propagation is faster then the driver reaction time (which is a realistic assumption).

Moreover, thanks to the `MutualExclusion` axiom, it's impossible to generate two `gearHandle` event at the same time which means that the gear handle can't be for example in Park and Drive mode at the same instant.

5 TransmissionControlUnit Class

The *TransmissionControlUnit* class is formalized thanks to the code reported in Listing 8.

Our first formalization of the Transmission Control Unit didn't take in account the possibility to have asynchronous sensors; the latest version of the Transmission Control Unit permits to manage asynchronous sensors thanks to internal memory modelled with three time dependent total values.

When handle the necessity to scale gears till the First with the assumption that the human reaction is way slower than sampling frequency and mechanical reactions, so, when the vehicle stops, the axiom which handle the gear scale manage to be "active" the necessary amount of times to scale all the gears.

The Transmission Control Unit guarantees that it doesn't raise more than one gear shift event per instant and it receives at most one event per instant from each sensor (this is described also in Section 2 and so guaranteed in VehicleSpeedSensor and EngineSpeedSensor class).

6 Annotations

During the last phase of our modelling we decided not to formalize the *Torque Converter* and this decision depends on the way the Torque Converter works.

The Torque Converter is a mechanical component that works coupling and decoupling the *Transmission Shaft* and the *Engine Shaft*. It solves its duty without the necessity to receive commands from any component of the system and this is the cause we have decided to remove it from our model.

Anyway, the state of the Torque Converter is really important for the system since it gives information that permits to insert or not to insert some gears and other details that aren't taken into account in this project.

7 Properties

In this Section 7 are reported the three properties we have proved in their decidable TRIO form, these formulae are available in their *Zot* form directly in Listings 3. In order to verify these three properties we needed to translate the from their “present/future” form to their “present/past form” because of some inherent limitations of *Spin*. The latter property has been verified only with *Zot* that doesn’t need any translation.

Listing 9: Property 1

```
actualGear = First & controlGearShift = TCUShiftOneUp ->  
  Futr(actualGear = Second, FluidDelay + ShiftDelay);
```

Listing 10: Property 2

```
actualGear = First & gearHandle = HandleShiftReverse ->  
  Futr(actualGear = Reverse, FluidDelay + ShiftDelay) &  
  Lasts_ii(transmissionShaftState = Detached, FluidDelay  
    + ShiftDelay));
```

Listing 11: Property 3

```
actualGear = First & gearHandle = HandleShiftPark ->  
  Futr(actualGear = Park, FluidDelay + ShiftDelay) &  
  Until(transmissionShaftState = Detached, gearHandle ◇  
    Nothing));
```
